Pravinkanna Parthiban

Senior Backend Engineer

pravinkannap@gmail.com | +919843638308 | github.com/pravinkanna | linkedin.com/in/pravinkanna | Bengaluru, India

SUMMARY

Backend engineer with 5+ years of experience building distributed systems and microservices in Go and Node.js on GCP and AWS. Most recently owned backend and cloud infrastructure for a product with 2M users. Previously scaled email ingestion to 1M concurrent IMAP connections, led a migration from AWS to GCP with zero downtime, and cut database costs by ~70%.

WORK EXPERIENCE

Zobaze Technologies | Backend Developer — Hyderabad | June 2025 – August 2026

- Owned the backend and GCP cloud infrastructure for a product serving 2M users, reporting directly to the CEO and setting technical direction across the stack.
- Improved stock accuracy from 85% to 99% across 2M businesses by redesigning the offline inventory system as an append-only transaction ledger, eliminating sync conflicts and retiring the reconciliation service.
- Resolved activation failures and duplicate subscriptions affecting 15% of paid accounts by moving subscription activation from the app to a Node.js service driven by payment webhooks.
- Lowered Firestore costs by ~20% by building a Golang archival pipeline for 700M+ sales and activity records that tiers data older than 3 months into BigQuery.
- Replaced an external vendor (NudgeNow) with an internal push notification and engagement platform built in Golang, processing 100K events/day across 2M businesses and eliminating recurring licensing costs.
- Led a GCP security overhaul across 13 projects: replaced all service account keys with keyless authentication, restricted every API key to approved apps, and shut down unauthenticated legacy services.
- Built an internal Claude Code plugin that captures tasks, meetings, decisions, research, and blockers in a searchable knowledge base, reaching 100% adoption across the company as the default daily workflow.

Vumonic Datalabs | Software Engineer — Bengaluru | July 2021 – May 2025

- Cut the delay in fetching new emails from 8 hours to under 1 minute by building a real-time email ingestion system in Golang that maintains 1M concurrent IMAP IDLE connections (~30K per node).
- Led the migration of 80 TB of storage, 30 Kubernetes services, and 5 databases from AWS to GCP with zero downtime through phased cutovers.
- Reduced database costs by ~70% by migrating MongoDB and Elasticsearch (8B+ records, 3M users) from Atlas and Elastic Cloud to self-hosted deployments with automated backups.
- Improved throughput by 40% by rewriting Node.js services in Golang with concurrent processing, and eliminated a class of runtime type errors through typed contracts.
- Productized the company's email dataset as Inboox.ai, a live SaaS for email marketers: built REST APIs, ingestion pipelines, search over 2M+ promotional emails from 10K brands, and subscription management using Golang and Node.js.
- Automated Docker builds and Kubernetes deployments with GitHub Actions across 30+ microservices, replacing fully manual releases with pipelines that deploy on every push.

SKILLS

Languages: Go (Golang), TypeScript/JavaScript (Node.js), Python, SQL

Databases & Messaging: PostgreSQL, MongoDB, Elasticsearch, Redis, Firestore, BigQuery, Kafka, RabbitMQ

Cloud & DevOps: GCP, AWS, Docker, Kubernetes, GitHub Actions (CI/CD), Prometheus, Grafana

EDUCATION

B.Sc. Computer Science — Trichy, India | 2018 – 2021

Bishop Heber College
